TITLE: Making holes in spinnerettes for synthetic filament using an optical quantum generator (laser) *68/65B*

SOURCE: Vestnik mashinostroyeniya, no. 10, 1966, 54-56 *laser applications, textile industry machinery*

TOPIC TAGS: steel, spinnerette, filament drawing spinnerette, spinnerette hole drilling, laser hole drilling, laser / OKh23N28M3D3T steel

ABSTRACT: The Scientific Research Institute of Light Textile Machinery has investigated the possibility of using lasers in making holes in filament-drawing spinnerettes. A ruby laser with a 0.7 J maximum radiation energy was used for making holes in OKh23N28M3D3T steel spinnerettes. It was found possible to make holes of almost cylindrical shape and with a conical entrance if desired. The hardness of the heat-affected zone did not undergo any substantial changes. Finished experimental spinnerettes with up to 40 holes were tested at the Kalinin Synthetic Fiber Plant, which found that the quality of filament

Card 1/2

UDC: 621.95.048

L 07828-67

ACC NR: AP6034022

obtained was not inferior to that made with conventional spinnerettes. The use of a laser substantially increased the productivity in spinnerette making and made it possible to use hard and brittle material such as glass, sital and alumina ceramics. The use of lasers might in the future permit making holes of various shapes. Orig. art. has: 4 figures.

TITLE: Formation of positive space charge in an electric field of high frequency in air

SOURCE: Ref zh.Fiz, Abs. 2090

REF SOURCE: Tr. Nauchn. ob'yedin. fiz.-matem. fak. ped. in-tov Dal'n. Vost., v. 4, 1964, 79-93

TOPIC TAGS: space charge, electric discharge ionization, air, uv radiation

ABSTRACT: An experimental study was made of the accumulation of positive space charge in a plane-parallel discharge gap, excited with an electric high-frequency field. The ionized air was carried away from the discharge gap by an air jet to the analyzing device, in which the ion current was proportional to the number of ions in the discharge gap. The experiments were made in dried air at atmospheric pressure. The range of frequencies was 1.5 - 10 Mcs, the distance between the electrodes 0.6 - 1.8 mm. The initial ionization was produced either by illuminating one of the electrodes with ultraviolet light, or by introducing into the gap, by means of an air jet, negative ions generated by an auxiliary corona discharge. It is shown that the positive space charge increases with the voltage amplitude almost exponentially in the frequency region where the amplitude of the oscillations of the positive ion becomes smaller than the distance between electrodes; this agrees with qualitative con-

SOURCE: Ref zh. Fiz, Abs. 2G91

REF SOURCE: Tr. Nauchn. ob'yedin. fiz.-matem. ped. in-tov Dal'n. Vost., v. 4, 1964, 94-98

TOPIC TAGS: space charge, rf field, electric field, electron trapping

ABSTRACT: The use of the apparatus and measurement procedure described in Abstract 2G90 [of the same source, Acc. nr. AR6021031] has made it possible to study the accumulation of negative space charge in a plane-parallel gap excited by a high-frequency electric field. It is shown that the density of the negative space charge varies with variation of the amplitude of the high-frequency voltage nonmonotonically, passing through two minima connected with variations of the coefficients of adhesion of the electrons to the neutral molecules. TITLE : Problems in Improving the Productivity of Forests
(Conference Held at the Forest Institute)
ORIG. PUB. : Vestn. AN SSSR, 1957, No. 4, 123-125
ABSTRACT : A meeting which was held at the Forest Institute in December 1956 is reported on. The content of reports by representatives of the science of forestry and its practice is described, in which questions about the contemporary state of the problem of improving forest productivity and of practical measures in this direction are touched upon, the future wood requirement in the USSR, and the significance of its dimensions in determining cutting age, etc. Means of raising the productivity of forests and improving their quality are also noted.--V. I. Klimov

and practical problems representing the basis of the work are analyzed and the authors of the studies are indicated. Attention is paid to the problem of raising the productivity of the forests; the problem of natural restoration, the cutting down of forests as part of maintenance, etc. It is pointed out that by cuttings that are part of maintenance, it is possible to reduce by 20-30% the growing period of the technically mature woods. Using the same method it is possible to improve the qualitative composition of mixed plantings, but it is impossible to raise the general productivity of the forest stands.

TITLE: Optical properties of CaF_2 in the 170-600 μ wavelength range

SOURCE: Optika i spektroskopiya, v. 19, 5, 1965, 783-787

TOPIC TAGS: spectrographic analysis, optic property, calcium compound, absorption coefficient, IR spectrometer

ABSTRACT: The CaF_2 transmissivity was measured in the wavelength range of 170-600 μ at room temperature and in the range of 150-350 μ at -90C by using a long-wave infrared spectrometer described by A. G. Zhukov (Opt. i spektr., 17, 284, 1964). The changes of the coefficient of transmissivity D at various wavelengths (λ) are represented in the attached diagram (see Fig. 1) for samples 0.4 mm (curve 1) and 1.96 mm thick (curve 2) measured at room temperature. The reflectivity (R) of CaF_2 was measured in the wavelength range of 40-110 μ at the angle of incidence of 25° (see Fig. 2). The absorption coefficient k was

calculated from experimental data. It changed at room temperature from 0.034 (at 170 μ) to 0.016 (at 420 μ). The transmissivity of CaF_2 at -90C was measured in a 1.95 mm thick sample at $\lambda=150-350 \mu$. At -90C, the value of k was 0.004, i.e., 5 to 10 times smaller than at room temperature. The refractive index n was calculated as 2.58 ± 0.06 from the maximum and minimum on the interference curve of transmissivity and from the formula $[(n-1)^2 + k^2] : [(n+1)^2 + k^2]$ (average error $\pm 4\%$). The authors thank V. E. Shvetsova for preparation of the low-temperature experiments and A. M. O'khovskaya for assistance in measuring. Orig. art. has: 4 fig., 4 formulas and 1 table.

TITLE: Optical constants of fused quartz in the far infrared region

SOURCE: Zhurnal prikladnoy spektroskopii, v. 4, no. 1, 1966, 68-70

TOPIC TAGS: quartz, refractive index, light absorption, IR absorption, IR spectrum

ABSTRACT: The transmission and reflection spectra for specimens of fused quartz of various thicknesses were measured in the 60-560 μ wavelength range. The resultant data were used for determining the indices of refraction (n) and absorption (k). The reflectance of a plate 25 mm thick was used for determining the index of refraction in the 50-90 μ wavelength range. In the 220-400 μ region the index of refraction was determined from the position of the maxima and minima in the interference transmission spectrum of a plate 0.258 mm thick. The data show a reduction in n from 2.07 in the 50 μ region to 1.94 at 90 μ . In the 220-400 μ region, n remains practically constant, varying from 1.89 to 1.92 with an average value of 1.91. The

Card 1/2

UDC: 535.312

ACC NR: AP6005476

index of absorption was calculated from the coefficients of transmission for plates with thicknesses of 1.05, 2.03, 4.07 and 12.35 mm with regard to the values of the refractive index. A curve is given showing the index of absorption as a function of wavelength for fused quartz at room temperature. This curve shows a reduction in k from 0.0165 at 60 μ to 0.0038 at 560 μ . The transmission factor of fused quartz is independent of temperature in the 250-550 μ region. Orig. art. has: 2 figures, 2 tables.

TITLE: Functioning of a thermal receiver which records radiation from slightly warm bodies

SOURCE: Pribury* i tekhnika eksperimenta, no. 2, 1964, 138-141

TOPIC TAGS: thermal receiver, bolometer, temperature measurement

ABSTRACT: An experimental investigation is reported of the effect of the temperature of a thermal receiver (bolometer) upon a signal in its circuit when the temperatures of the test object, the surrounding medium, and the bolometer itself differ only slightly. When the bolometer temperature is higher than that of the object, a rise in the bolometer's temperature results in an increase of its signal. A vacuum low-inertia (0.02 sec) bolometer with a sensitivity of 7×10^{-10} w

Card 1/2

ACCESSION NR: AP4033134

was used for the registration of modulated-at-10-cps test-object temperatures within 186-300K and 300-400K. A theoretical estimation based on an analysis of the radiative heat exchange between the bolometer and the object was shown to be in satisfactory agreement with the experimental data. It was found that the bolometer's usable signal can be raised by the bolometer's own temperature, which is essential when the object temperature is close to ambient. "The authors wish to thank A. M. Ol'khovskaya for her help in carrying out the experiments." Orig. art. has: 1 figure, 8 formulas, and 2 tables.

TITLE: Apparatus for the fine crushing of preparations

PERIODICAL: Pribery i tekhnika eksperimenta, no.3, 1962, 150-153

TEXT: Description of a simple apparatus giving more uniform and faster crushing of preparations than the ultrasonic method. Shock waves obtained as a result of an electric discharge in a liquid are used to break up the sample. In general this type of discharge produces a damped oscillation with a frequency $\sim 10^5$ c/s. The apparatus consists of an ebonite container with two electrodes and a hermetically sealed lid. The power supply is from a half wave rectifier using a step up transformer with a number of voltage tapings to vary the output voltage. A condenser is charged through a resistance and then discharged between the electrodes in the working space. Uniformity of the crushed material is helped by the additional mixing action effected by the shape of the lid. The discharge duration is of the order of milliseconds and hence has an explosive character which disrupts

Card 1/2

Apparatus for the fine crushing of ... S/120/62/000/003/035/048
E039/E135

the material in the working chamber. By the use of an enclosed chamber the effect of the shock wave is enhanced and the electrode voltage can be reduced to $\sim 1 - 2$ kV (instead of 30 - 250 kV used in other systems). Typical microphotographs are given showing that carbon dust produced after 5 - 10 minutes in this apparatus is of the same order of size and more uniform than carbon dust produced by a ball mill in 60 minutes at 200 r.p.m. Other media than water can be used in the apparatus, the action of the shock waves increasing with increase in density of the liquid. TITLE: Polarization properties of wire gratings in a longwave infrared region

SOURCE: Zhurnal prikladnoy spektroskopii v 3, no. 5, 1965, 410-414

TOPIC TAGS: wire, wire product, IR grating, IR grating measurement, light
polarization, IR measurement 9M

ABSTRACT: The authors investigate wire gratings with relationships $b/t = 0.73$ and 0.87 (where b is the width of the clearance between the wires, and t is the spacing) in the wavelength region of $60-650 \mu$. The measurements were performed with a longwave IR spectrometer. The gratings consisted of square metal frames, one side of which was strung with tungsten wire coated with a gold layer 0.5μ thick. On the basis of experimental data obtained, the authors conclude that the polarizing capabilities of the wire grating studied is at least 95% in the $300-650 \mu$ wavelength. The employment of two gratings in one polarizer in the $150-650 \mu$ wavelength makes it possible to obtain almost complete polarization. The transmission coefficient of

Card 1/2

UDC: 535.5

L 10298-66

ACC NR: AP6000021

the polarizer studied is 97%, which surpasses the data of other types of polarizers.
The polarizers described are simple in usage and may be used in a convergent beam.

 TITLE: Polarizing properties of echellette gratings in the long-wave infrared region
 SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 6, 1966, 560-563
 TOPIC TAGS: light reflection, light polarization, spectrometer
 ABSTRACT: Data are given on the polarizing properties, in the 62 to 650 micron band, of dispersion and filtering echellette gratings used in the monochromator of a long-wave spectrometer (see A. G. Zhukov, Optika i Spektroskopiya, Vol. 17, p 284, 1964; English translation in Optics and Spectroscopy).
 Reflection of polarized light by the gratings was measured as a function of the orientation of an electric field to the grating steps.
 Two wire grids, having periods of 30 microns and spaced a few millimeters apart, served as a highly effective polarizer in the 62 to 650 micron band.
 Two cases are considered: 1) in which the electrical field vector is at right angles to the plane of incidence and parallel to the grating steps, and 2) in which the vector is parallel to the plane of incidence and at right angles to the steps. The ratios a_{0p}/a_{0s} and a_{1p}/a_{1s} (where a_{0p} and a_{0s} are the zero order coefficients of reflection for the two cases and a_{1p} and a_{1s} are the first order coefficients, respectively) are used as the measures of grating reflectivity. Curves are plotted for the two cases showing the absolute values of the coefficients and the values of the ratios as dependent on the ratio of the wavelength to grating period. Also shown are curves of summed ratios a_p/a_s plotted as functions of wavelength for three sets of gratings studied. Some of the results differ from those of other authors. Sh. Ye. Mikeladze [see preceding abstract]

Periodical : Usp. mat. nauk, 9, No 3(61), 276-277, Jul-Sep 1954

Abstract : In the reviewer's opinion the essential deficiency of the book is the absence of methods for numerically solving algebraic and transcendental equations and that the contents of the book do not correspond at all with its title. The book is devoted in the main to certain problems in the calculus of finite differences and in the theory of approximation, which are expounded in a very theoretical and abstract fashion. The author disregards the interests of the practical workers in applied fields, which is strange in view of the title of the book. The book is very inconvenient for the study of numerical analysis; it is impossible to recommend it for practicing computers. The best part of the book is its summary of formulas.

TITLE:

Limit Theorem for Difference Operators

PERIODICAL:

Uspekhi matematicheskikh nauk, 1959, Vol 14, Nr 3, pp 129-136 (USSR)

ABSTRACT:

Let the equation

$$(1) \quad \frac{\partial u}{\partial t} = a_0 u + a_1 \frac{\partial u}{\partial x} + a_2 \frac{\partial^2 u}{\partial x^2} + \dots + a_n \frac{\partial^n u}{\partial x^n}$$

be considered with constant real coefficients on the whole real line. Let the linear operator F be defined by :

$$(2) \quad u^1(x) = F u^0(x),$$

where it is $u^0(x) = u(t_0, x)$ and $u^1(x) = u(t_0 + \tau, x)$. Let

the operator F be approximated by a difference operator G , so

that $u^*(x) = Gu^0(x) = \sum_m b_m u^0(x + mh)$, where m runs through

a finite set of integer values. It is said that G has the index p , if for every polynomial $f(x)$ of degree $\leq (p-1)$ it

Card 1/3

Limit Theorem for Difference Operators
